

First results from coupled physical- biogeochemical modelling within the BONUS+ project ECOSUPPORT

Bo Gustafsson, Kari Eilola, Ivan
Kuznetsov, Markus Meier, Thomas
Neumann, Oleg Savchuk, et al.

Baltic Nest
Institute

Outline

- Recap of modeling strategy
- Overview of the modeling tools
- Key processes
- First results

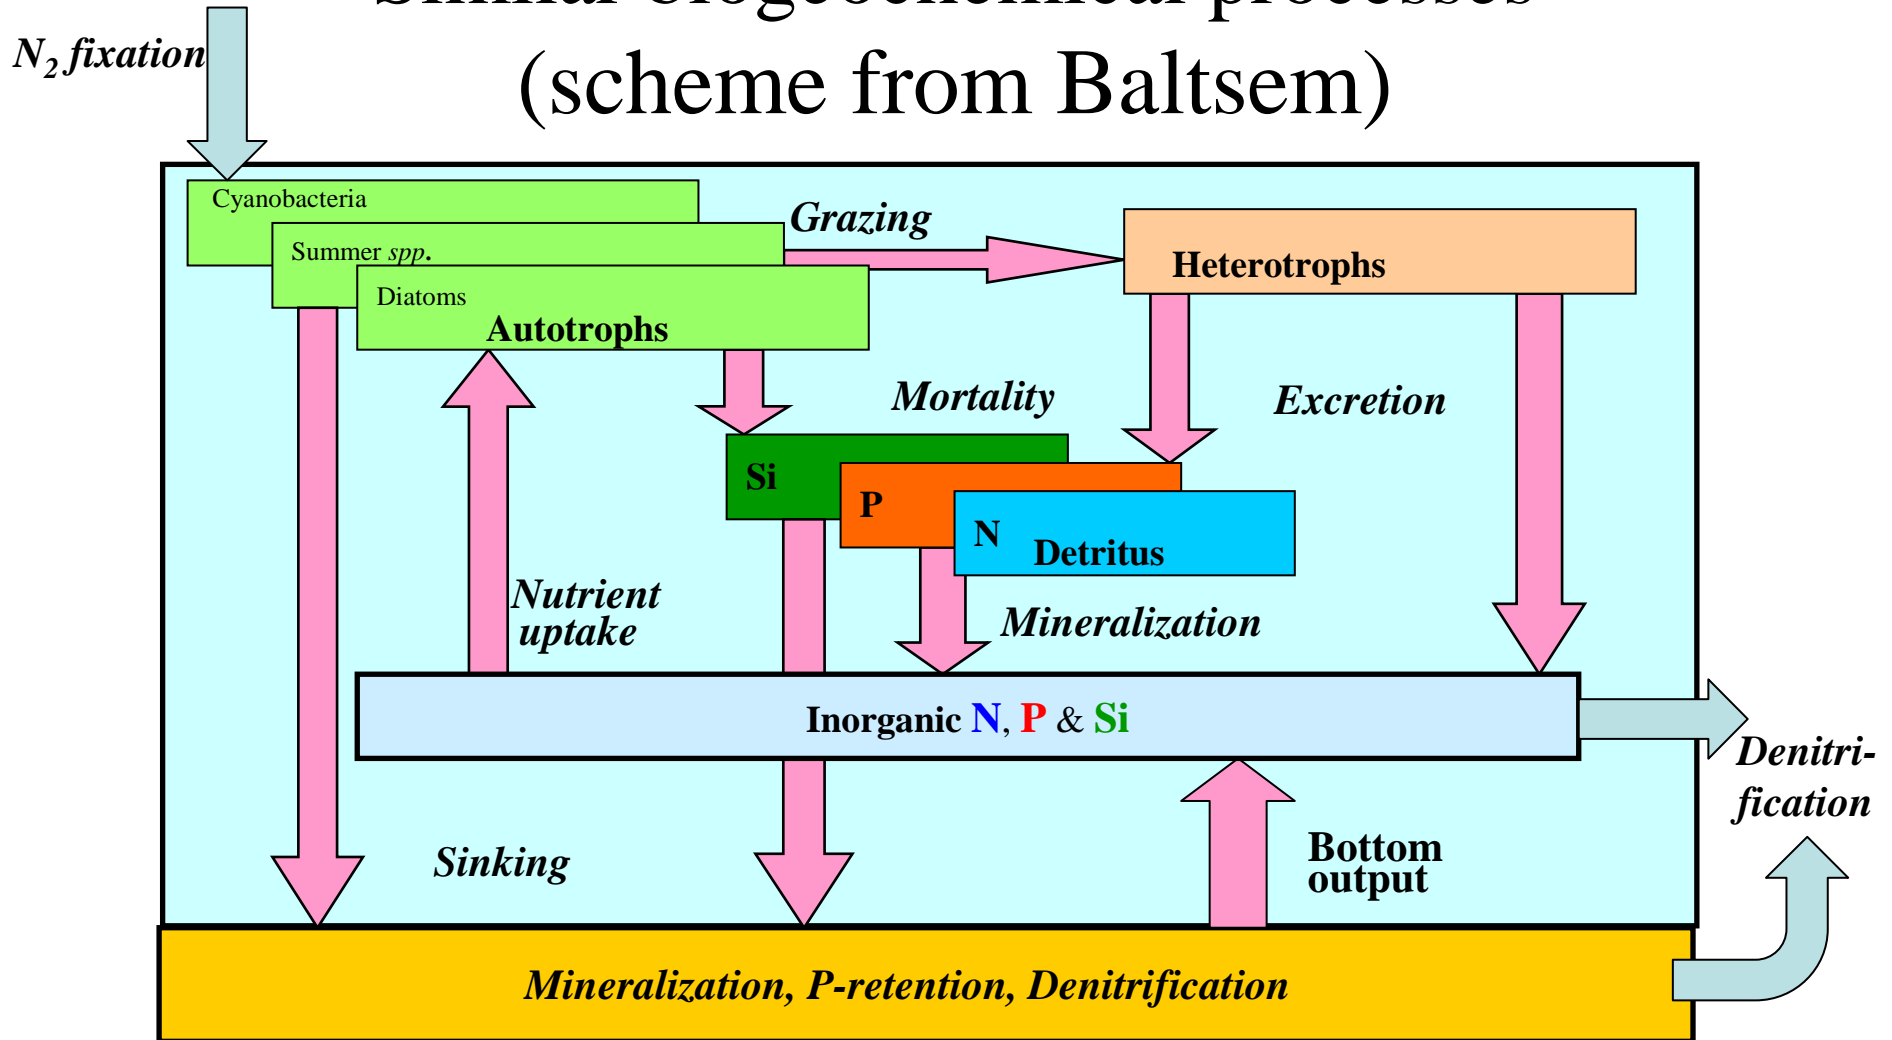

Three time periods

- 1961-2006: Hindcast/validation/control period
- 1850-2006: Hindcast from “pristine” – present
- 1960-2100: Scenarios forced by climate GCM’s

Three models

- **BALTSEM**
 - 1-D coupled basin model (13 basins)
 - Developed jointly at Stockholm and Gothenburg Universities, now all development at the Baltic Nest Institute, Stockholm University
- **ERGOM**
 - 3-D high resolution (3nm)
 - Developed at Institute for Baltic Sea research in Warnemuende
- **RCO-SCOBI**
 - 3-D high resolution (2nm)
 - Developed at SMHI

Similar biogeochemical processes (scheme from Baltsem)

But key differences

- Differences in treatment of dead organic matter: one state-variable for each nutrient vs. a single variable with constant N/P ratio
- Differences in parameterizations of P sediment dynamics, e.g. P bound to FeOOH
- Resuspension/sediment transport: mechanistic description (from waves and currents) vs. simple parameterization
- Resolving coastal boundary and deep pits vs. large-scale integrated basins
- Different vertical resolution

Model validation/intercomparison study

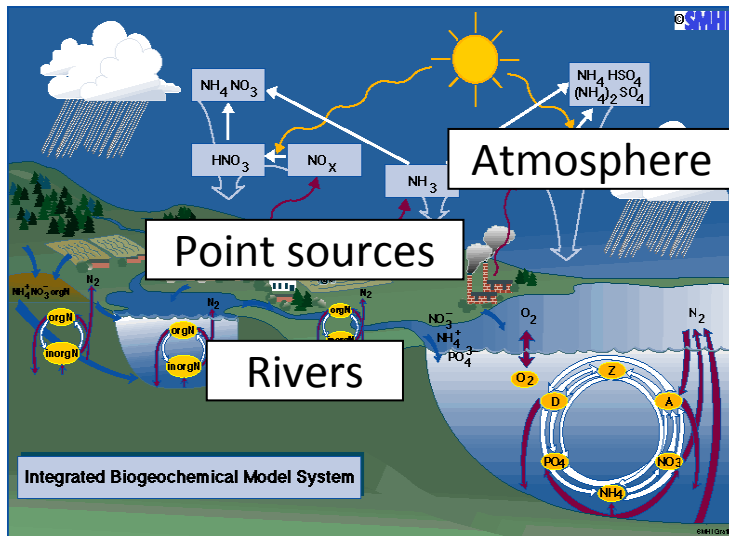

- Same physical forcing 1961-2006
 - Somewhat different nutrient loads
 - Different initial conditions
- > state-of-the-art models at the beginning of the project

Data from Baltic Environmental Database (BED)

NB: Work is in progress

ECOSUPPORT

Bioavailable nutrient loads in models

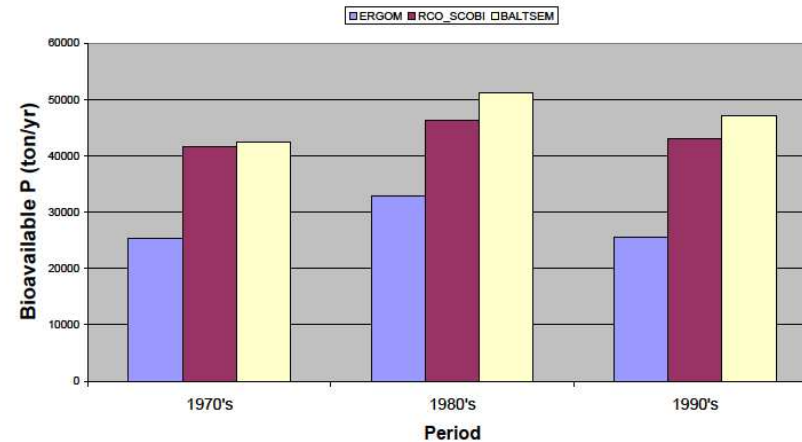

A common nutrient loading to the models is not ready yet!

Total nitrogen supply to Baltic Sea

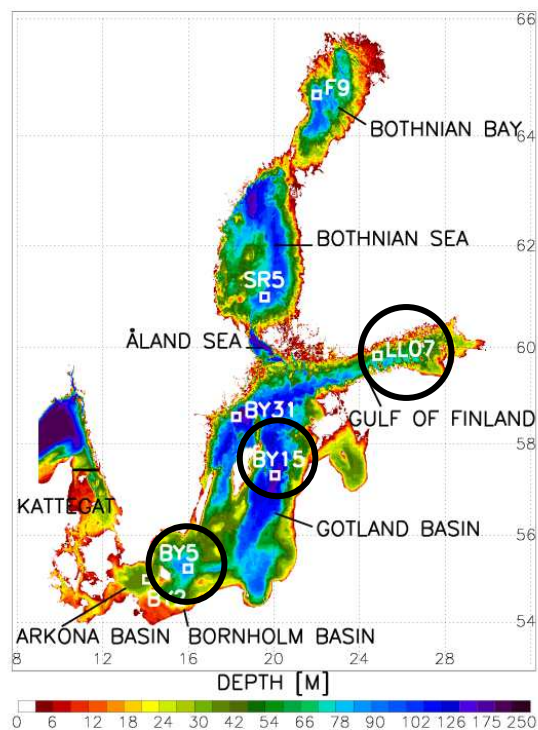

Total phosphorus supply to Baltic Sea

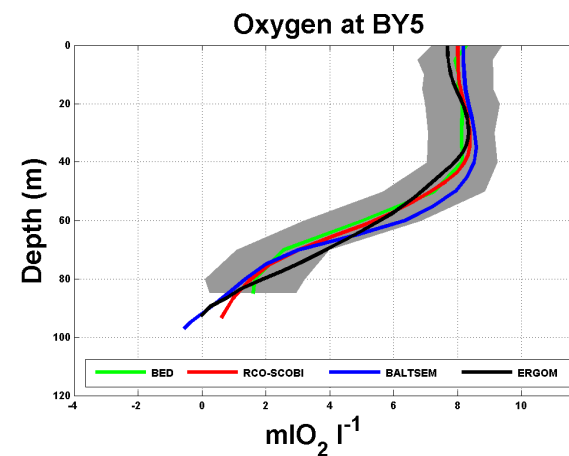

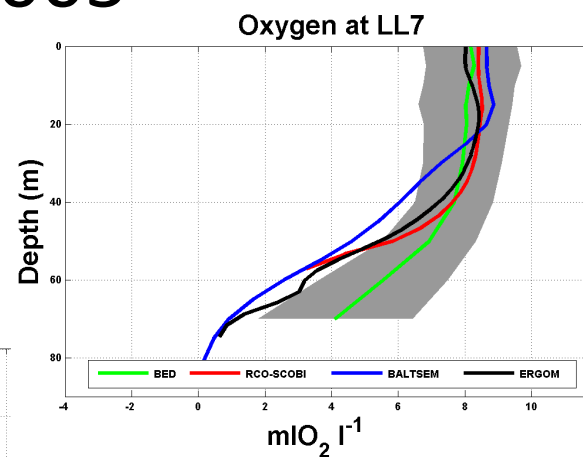

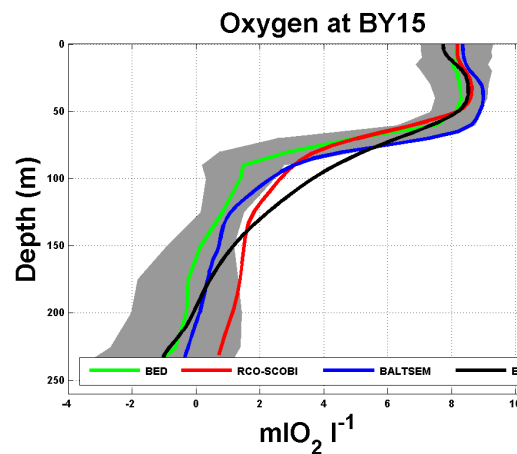

ECOSUPPORT

Annual average 1970-2005

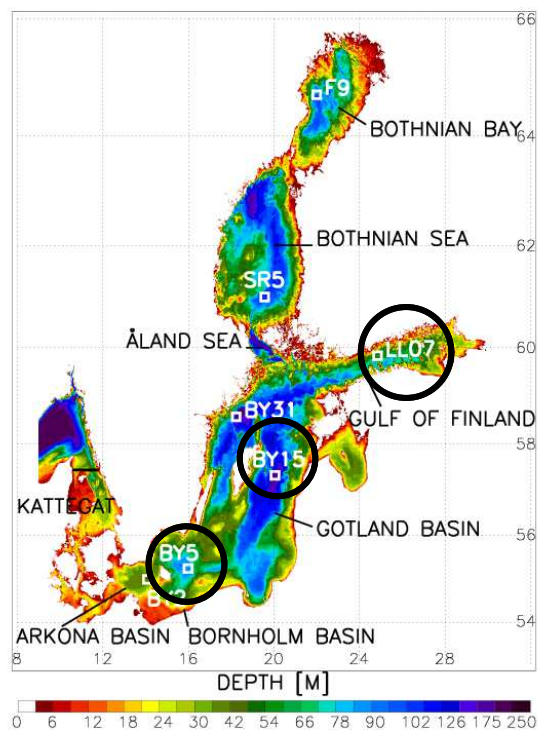

Station list

Oxygen

ECOSUPPORT

Annual average 1970-2005

Station list

Phosphate

Note:

Volume below
150m is only about
2-3% of total Baltic
proper volume

Phosphate at LL7

Phosphate at BY5

Reconstruction of loads for 1900-2006

Sources:

- Paper by Schernewski and Neumann, 2005
- Paper by Savchuk et al., 2008

Reconstructed for a century ago:

- TN 391 Kt N a century ago vs. 1015 Kt N in 1997-2003, i.e. **2.5** times less
- TP 11.4 Kt P a century ago vs. 42.3 Kt P in 1997 – 2003, i.e. **4** times less

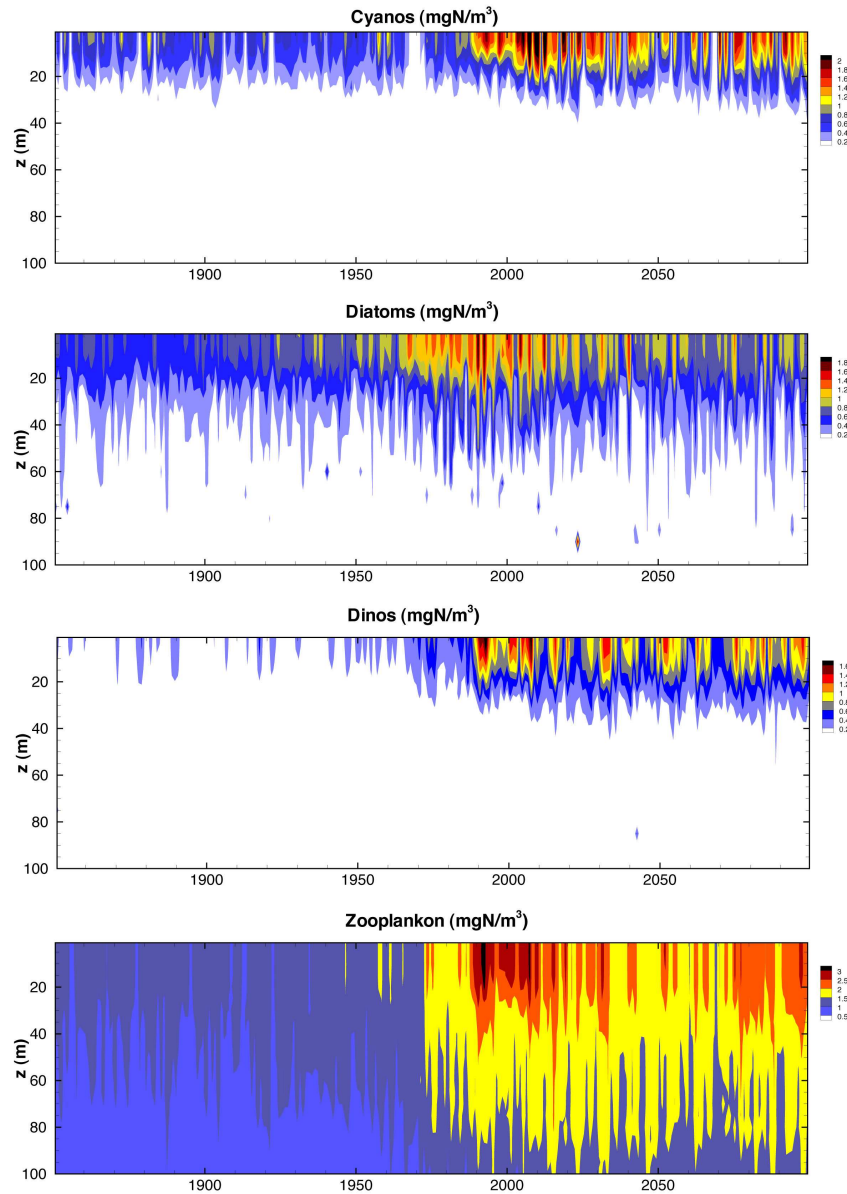

To do in 2010-2011: What about the past?

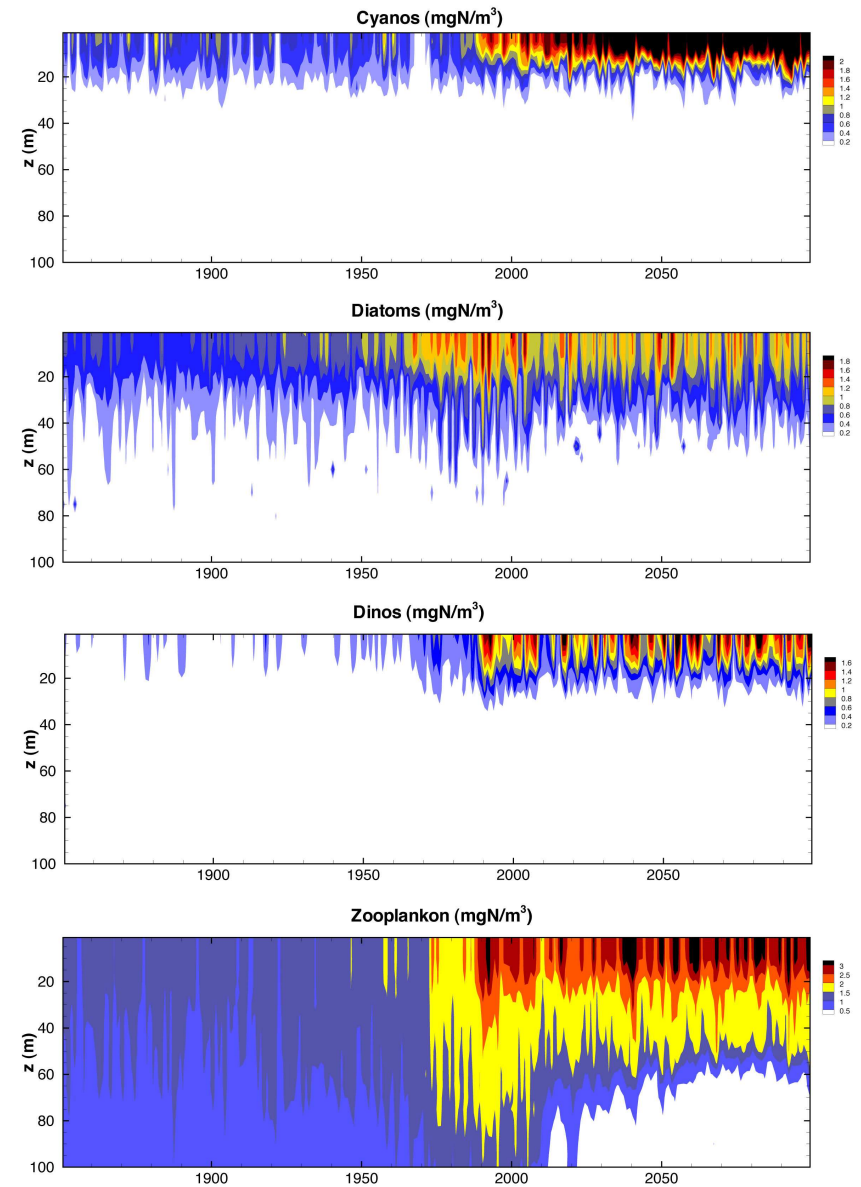

To do in 2010-2011: and the future?

better?

worse?

Conclusions

- Models are generally describing large scale features within natural variability
- Validation will be repeated with updated forcing and final improvements of models
