

Communication by Sam Benedict, GEWEX GHP International Coordinator, 16 July 2012

On behalf of the GEWEX Hydroclimatology Panel (GHP) Co-Chairs and the Director of the International GEWEX Project Office, please see the attached Regional Hydroclimate Project (RHP) Criteria. The plan to revise the RHP Criteria and to have all established projects reapply for RHP status and any newer projects seeking RHP status to apply under the new version of the criteria, was initiated at the Pan-GEWEX meeting in August 2010. The work of reviewing and refining these criteria has gone on since that time with your inputs taken from the October 2011, GHP meeting and subsequently from other changes that you suggested during the review cycle of earlier drafts, in which you all participated. Panel members are also copied on this message for their further interest in this process and others on distribution are involved in the development of possible new Regional Projects that will need to be proposed under these new criteria.

It is, therefore, felt that this version is ready to be acted upon and we are asking the Leaders of each existing RHP and those leading possible new Projects, to take time to prepare the necessary material (i.e. science plans, and related documentation, that address these new criteria and that show compliance with them in as many respects as possible).

For the existing RHPs please specifically, note section 5:

“...How current RHPs should address the new requirements

All current RHP's that have been underway for 5 years or more, MUST apply for initiation phase status. At their discretion, existing RHPs may also apply for immediate transitioning to full working phase, by provision of documentation to the GHP that all the Section 3 requirements are being met. Final approval is subject to the decision by the GEWEX Scientific Steering Group...”

We hope an initial (draft) set of material can be provided to us (gewex@gewex.org) by **1 September 2012**,

We expect then to have all the available material before the 11-13 October 2012 GHP meeting at Sydney, Australia, so we can finalize the process at that time.

For more background on this matter, as you know, GHP is responsible for the GEWEX RHP's. As part of the strategic planning process that is underway to define the next phase of GEWEX (2013 and beyond) the GEWEX Scientific Steering Group (SSG) has asked that all current work be reviewed in the context of new imperatives and challenges. Now that the Criteria have been vetted, the SSG wishes for them to be applied to all the existing RHPs and possible new regional studies.

The action is to address each item of the Criteria and follow the reporting process by providing the appropriate documentation.

New Regional Hydroclimate Project (RHP) Approval/Assessment Criteria

(July 16, 2012)

1. Considerations

Some criteria are needed to ensure that a proposed RHP should be adopted by GHP. These criteria are for the benefit of GHP, GEWEX and WCRP. The outcome of the process, whereby a prospective RHP submits a plan for review and endorsement by the GEWEX Scientific Steering Group (SSG), should be a viable, mutually beneficial/synergistic Project.

The RHP is expected to adhere to the requirements in sections 2 and 3 below, providing the regional level science and implementation that yields results/tools and to making the scientific conclusions, products and tools openly available.

The role of GHP/GEWEX is to:

- Provide forum for fostering cross-collaboration between RHPs in terms of expertise, instrumentation development, modeling exercises, observational data exchange etc.
- Increase visibility of RHPs by promoting sessions in international meetings and conferences.
- Promote the RHPs at the programmatic level: i.e. with WCRP and its international sponsors through the web, regular electronic and paper newsletters, mailing lists, etc. and representation at meetings such as JSC.

Now, therefore:

It is envisioned that a RHP will be a 5-10 year project.

Some criteria may not be met at the outset but an RHP can move towards delivering on those criteria as it matures. In some sense an RHP can be measured periodically on their progress towards these metrics.

When a project is first adopted as an RHP it will be considered to be in an initiation phase. As it matures and demonstrates progress towards fulfilling its science plan, it will be considered a full working RHP. A new RHP will be assessed after two years to see if it has moved beyond the initiation phase. If it has not the status as a RHP will be reassessed, as RHPs are not intended to be in the initiation phase indefinitely.

Since all existing RHPs will need to reapply under the new organizational structure, part of their "renewal" process will require that they submit for review at GHP a science synthesis for the current phase of their work and material related to their future strategy that will constitute the basis of a new science plan.

2. RHP Criteria at the outset of a project

A science plan should state the central science and applications questions to be addressed by the RHP, and how they contribute to the GEWEX Science Imperatives that relate to such topics as datasets, analysis, processes, modeling, applications, technology transfer, and capacity building. Results are also meant to contribute to important science "grand" challenges, such as the need to address terrestrial water storage changes and close the water budget over land and to better understand and predict variations and changes in precipitation.

The project plan should also include:

1. A science plan with an overall science and applications goal and proposed tasks to achieve it.
2. A coordination mechanism (e.g., a Science Steering Group or equivalent) including a GEWEX contact (e.g., SSG chair, or project coordinator)
3. RHPs should have an end date and an exit plan that includes a science and applications synthesis and data archival procedure.
4. Adequate resources and personnel with potential sources of funding or existing funding identified.
5. A mechanism for collecting, managing and providing access to hydroclimatological data sets with participation in the international exchange of scientific information and data.

3. Requirements for a full working RHP

1. Demonstrate progress in implementation of the initial phase conditions
2. Continue to meet all RHP requirements
3. An up-to-date web presence
4. Demonstrate progress to contribute to the development and diagnosis of atmospheric-hydrologic–land surface models
5. Participate in joint RHP studies in cross-cut activities
6. Participate in other ESSP activities with other Panels and groups outside GEWEX if feasible
7. Share its new knowledge, experience and models through the publication of scientific results, open science meetings and relevant GHP meetings and activities

4. Reporting requirements for all RHPs

The main reporting requirement for RHPs, whether in the initiation or full working phase, will be annual reports on progress to the GHP as measured against the GEWEX imperatives and detailed in the RHPs science and implementation plan.

RHPs transitioning from the initiation phase to full RHP status will be required to provide a report on progress and an updated science and implementation plan.

At the end of a RHP a synthesis of the RHPs activities including the science, capacity building and technology transfer which was achieved should be compiled and published.

5. How current RHPs should address the new requirements

All current RHP's that have been underway for 5 YEARS OR MORE, MUST apply for initiation phase status. At their discretion, existing RHPs may also apply for immediate transitioning to full working phase, by provision of documentation to the GHP that all the Section 3 requirements are being met. Final approval is subject to the decision by the GEWEX Scientific Steering Group.
